

Daily Work Report - 16/05/2026 , **18/05/2026 , 19/05/2026**

Please find below the summary of tasks completed by our team: -

Ashvin (AI / ML) - 19/05/2026

Today Worked on testing and analyzing the scanner application's document management features. Multiple sample documents were scanned to verify page detection and image processing quality. The scan rotation and manual cropping options were tested to ensure accurate document adjustment. PDF creation and multi-page document export were checked for smooth functionality and proper formatting. File preview functionality was reviewed to confirm scanned documents opened correctly after saving. Additional testing was carried out on document upload and sharing features within the application. The user interface was examined for better usability and smoother workflow during scanning operations. Basic debugging was completed to identify minor issues related to image alignment and file storage. Application performance was monitored during continuous scanning to evaluate stability and response time. Optimization suggestions were discussed for improving scan processing efficiency. Testing results confirmed that the scanner application handled document scanning and exporting effectively. Overall progress was satisfactory, and further enhancements will focus on improving user experience and scan accuracy.

Anena (AI / ML) 16/05/2026

Worked on improving the scanner module by enhancing image and video validation, optimizing NSFW detection accuracy, refining blur and quality analysis, improving frame-processing performance, fixing detection-related issues, and testing the system with multiple media samples to ensure better stability and reliable moderation results.

Also focused on improving media filtering logic to reduce false-positive detections and enhance scanning consistency across different file types. Performed additional testing on metadata handling, frame extraction, and safe-media validation workflows to ensure smooth processing and improved overall scanner performance.

18/05/2026

Worked on improving the scanner module by enhancing image and video validation, optimizing NSFW detection accuracy, refining blur and quality analysis, improving frame-processing performance, fixing detection-related issues, and testing the system with multiple media samples to ensure better stability and reliable moderation results.

Also focused on improving media filtering logic to reduce false-positive detections and enhance scanning consistency across different file types. Performed additional testing on metadata handling, frame extraction, and safe-media validation workflows to ensure smooth processing and improved overall scanner performance.

Further improvements were made to scanner response handling, confidence score evaluation, and backend processing optimization to support faster and more reliable scanning operations. Conducted debugging and validation checks to ensure accurate detection behavior and stable scanner execution during continuous media uploads and real-time analysis tasks.

19/05/2026

Today's work focused on enhancing the scanner application and testing its core functionalities. Document scanning accuracy was checked using different types of files and paper formats. Image clarity and edge detection performance were tested under various lighting conditions to ensure better scan quality. The auto-cropping feature was verified and adjusted to improve alignment during scanning. PDF export functionality was also tested for proper file generation and readability. Additional checks were performed on image enhancement options such as brightness and contrast adjustment. The application's file saving process was monitored to ensure scans were stored without errors. UI responsiveness was reviewed to improve navigation between scanning and preview sections. Minor bug analysis was completed for scan preview and document sharing features. Performance testing showed stable operation during repeated scanning tasks. Suggestions were noted for improving scan speed and reducing processing delay. Overall, the scanner application performed efficiently during today's testing session.
