

DAILY WORK REPORT

Date: 09/05/2026

Team Task Summary

Anoop K

Role: Python Developer

Project: Investor App

Work Completed:

Super Admin session Investor Module API development is in progress and under active processing.

The remaining functionalities, validations, and response handling are being implemented and tested to ensure smooth performance and proper data management.

Cinda sibichan

Role:Python Developer

Project: Investor App

Work Completed:

- Developed an API to **retrieve staff details by Staff ID**, enabling administrators to fetch complete information of a specific staff member with proper validation and structured response handling.
- Updated the **User Registration / Create Account API** to support the newly implemented **Role Setup system**. The registration flow was modified to:
 - Assign roles during account creation.
 - Handle role-based validations and permissions.
 - Ensure proper linkage between users, roles, and access controls.
- Implemented an API for **preselected permissions based on roles**, allowing automatic retrieval of default permissions associated with a selected role. This improves consistency and reduces manual permission configuration.
- Developed an API for **assigning permissions directly to staff members**, enabling more granular access control beyond role-level permissions where required.

ALBIN MATHEW

Role:Python Developer

Project: Academic App

Work Completed:

Today, I worked on refining and stabilizing the **LMS Assessment and Mock Test workflow** by aligning the existing **Assessment module** with the new **Mock Test section architecture** without modifying the core system design.

I researched and validated the collaboration approach between the **Assessment and Mock Test modules**, confirming that the same **backend engine, evaluation workflow, and APIs** can be effectively reused with only frontend/UI-level naming changes and workflow adjustments. This approach improves maintainability and avoids unnecessary duplication in the system architecture.

Additionally, I refined the **serializers**, strengthened the **submission and result lifecycle handling**, and added **production-safe validations** to improve reliability and data integrity. I also enhanced the **assessment state management**, including workflows for **under-review assessments and published result handling**.

Furthermore, I continued optimizing the **teacher evaluation, review, and result publishing workflows** across **MCQ, descriptive, and mixed-type assessments**, ensuring better consistency, scalability, and academic accuracy throughout the LMS evaluation system.

Karthika Jayaraj

Role:Python Developer

Project: Investor App

Work Completed:

Today, I updated the KYC API to improve functionality and data handling.

I also updated the database settings and configurations as required for the application.

Additionally, I conducted further research on the Investors App UI to better understand its workflow, design structure, and user experience.

Adithya P A

Role:Flutter Developer

Project: Investor App

Work Completed:

Today, I updated the KYC API to improve functionality and data handling.

I also updated the database settings and configurations as required for the application.

Additionally, I conducted further research on the Investors App UI to better understand its workflow, design structure, and user experience.

MUHAMMED SHIBIN K

Role: Game Developer

Project: Academic project, Rankify Test Battle

Work Completed:

Today, I focused on developing the narrative presentation and cinematic flow for the escape room game. I refined the introduction sequence by redesigning the cutscene structure scene-by-scene to create a stronger emotional connection and smoother storytelling experience. I also expanded the character depth of the old man by establishing his background, motivations, and emotional connection to patriotism, helping the story feel more grounded and believable.

In addition, I fixed several gameplay and interaction-related bugs to improve overall stability and user experience. I also made changes to parts of the UI layout to achieve a cleaner presentation and better visual consistency with the game's atmosphere and theme.

Date: 11/05/2026

Team Task Summary

Devanand R

Role: UI/UX

Project: Investor App

Work Completed:

I have designed the **Overview section in the Staff Management screen**, focusing on presenting key staff-related information in a clear and structured format for better monitoring and accessibility. The current structure is completed, and the next step is to **integrate Pie Charts for visual data representation** and add the **Branch field** to enhance data categorization and branch-level visibility.

In addition, I have **redesigned the Reset Password section**, improving the flow, layout clarity, and overall usability to ensure a smoother and more intuitive password management experience.

Cinda sibichan

Role:Python Developer

Project: Investor App

Work Completed:

Developed an API for **creating branches**, enabling administrators to add and manage branch details with appropriate validations and structured data handling.

Implemented an API for **listing branches**, allowing retrieval of branch information for administrative management and frontend integration.

Rest of the time i am focusing on the attendance and lottery projects requirements reviewing.

Karthika Jayaraj

Role:Python Developer

Project: Investor App

Work Completed:

Today, I researched the Investors App UI to better understand its workflow, design structure, and overall user experience.

Additionally, I modified the database settings and checked the working of the login functionality to ensure proper authentication flow.

Adithya P A

Role:Flutter Developer

Project: Investor App

Work Completed:

Today, I successfully completed the profile module for the Investors App. The module implementation includes the required UI sections and overall layout structure aligned with the application design standards.

Additionally, I conducted research on implementing push notifications using Firebase, including notification workflow, configuration process, real-time message handling, and integration requirements for the application.

The completed work ensures better user profile management and maintains consistency with the overall application interface.

MUHAMMED SHIBIN K

Role: Game Developer

Project: Academic project, Rankify Test Battle

Work Completed:

Today, I finalized the core design and gameplay structure for the Trivia mini-game. The game is designed around a fast-paced batch question system where players must answer a continuous set of questions as quickly as possible. I planned and refined the scoring mechanism by integrating a timer-based evaluation system, where the player's final score is calculated using the total number of questions completed along with the total time taken to finish the batch.

I also finalized the fail condition logic for the game flow. If the player answers any question incorrectly, the session immediately ends, increasing the competitive and high-pressure nature of the gameplay. This system is intended to create a more engaging challenge and encourage players to improve both speed and accuracy.

In addition, I created and refined the introductory cutscene for the escape room game to properly justify the gameplay situation and emotionally connect players with the story before entering the puzzle experience. The cutscene was designed with scene-by-scene storytelling, character establishment, and atmospheric presentation to create a smoother narrative transition into the gameplay.

I also continued refining the overall gameplay flow, balancing the pacing of question progression, score validation logic, UI presentation, and user experience to ensure both the Trivia and Escape Room experiences feel smooth, immersive, and rewarding.
