

DAILY WORK REPORT

Date: 27/05/2026

Team Task Summary

Anoop K

Role: Python Developer

Project: Investor App/LMS Project

Work Completed:

A SLAMS Track LMS project dashboard page staff management session was successfully completed.

The staff add database functionality and API creation were implemented and tested successfully.

Additionally, a SLAMS Track LMS project meeting was conducted to discuss the project requirements,

workflow, database structure, and overall implementation process in detail.

The discussion also covered future development plans, module integration, and system functionality to ensure smooth project execution.

Cinda sibichan

Role:Python Developer

Project: Investor App/LMS Project

Work Completed:

- Developed an API for **creating student accounts**, including validation handling and integration with the LMS user management system.
- Updated the **Teacher APIs**, refining functionality and resolving issues to ensure compatibility with the latest database structure and role management flow.
- Identified and resolved **database-related errors**, improving data consistency and stabilizing API functionality.
- Structured and created the **Student database schema**, including:
 - Student profile management structure.
 - Relationship handling with users and roles.
 - Implementation of role-based **User ID generation format** for students.
- Verified the **Administration Staff UI** and the **Teacher Application UI** for the **Slams Track Project**, reviewing:
 - UI consistency and workflow alignment.
 - Feature completeness and usability.
 - Areas requiring corrections or improvements.
- **Compensation Work (25/05/2026 – 06:00 PM to 07:00 PM):**
 - Started working on the **Login API** for the LMS system, focusing on authentication flow and integration with role-based access handling.
 - Participated in discussions regarding the **Finance section in the Admin Panel**, covering expected functionalities, workflow considerations, and possible implementation structure.

Albin Mathew

Role: Python Developer

Project: Investor App

Work Completed:

Today, I strengthened the Follow-Up lifecycle architecture in the Telecaller CRM by separating operational lead statuses from KYC verification statuses to eliminate workflow confusion and inconsistent frontend rendering. I corrected the backend business logic so that lead statuses now represent only CRM operational stages such as “Needs Follow-up” and “Converted,” while KYC verification stages like “Started,” “Submitted,” “Rejected,” and “Approved” are managed independently through the KYC lifecycle system.

I also improved the serializer architecture by implementing strict production-safe validations, lifecycle restrictions, normalized operational status handling, and secure KYC edit-locking rules. Additionally, I refined the follow-up update validation flow to prevent invalid lifecycle transitions, restrict unauthorized status manipulation, and allow telecallers to continue operational follow-up activities without modifying secured KYC verification data.

On the frontend, I redesigned the Follow-Up dashboard logic to display operational statuses and KYC verification statuses separately, fixed dynamic rendering and modal lifecycle issues, corrected filtering inconsistencies, and improved KYC verification badge handling. I also implemented selective field locking so that only KYC-related fields become read-only after submission while operational follow-up tracking remains editable.

Furthermore, I stabilized the Follow-Up APIs by tightening queryset filtering, improving payload validation, adding production-safe error handling, protecting invested leads from modification, and resolving compatibility issues caused by older database lifecycle values.

Adithya P A

Role:Flutter Developer

Project: Investor App

Work Completed:

Today, I successfully completed the KYC Review Status pages for the Investors App, ensuring proper UI flow and status handling for the KYC verification process.

Additionally, I completed the Add Money section in the Wallet Card module, including the required UI structure and user interaction flow.

The completed work was integrated while maintaining consistency with the overall application design and user experience.

MUHAMMED SHIBIN K

Role: Game Developer

Project: Academic project, Rankify Test Battle

Work Completed:

- Added new question sets to the trivia database.
- Worked on refining the overall gameplay progression system by improving transitions between mini-games, trivia sections, and level completion flows.
- Improved player guidance systems by redesigning UI layouts and visual hierarchy to make gameplay objectives easier to understand during interactions.
- Continued enhancing the Collector Simulator experience by refining drag-and-drop mechanics and improving usability of task assignment systems.
- Organized and optimized project assets to maintain cleaner project structure and improve workflow efficiency during development.
- Worked on improving loading flow and user feedback systems during scene transitions and database operations.
- • Added and tested new visual assets and interface elements to improve the presentation quality of menus and gameplay screens.
- Continued implementing and testing audio feedback systems for buttons, gameplay actions, and environmental interactions.
- Optimized scene elements and UI assets to improve mobile performance and reduce unnecessary memory usage.
- Fixed various gameplay logic and UI interaction bugs discovered during gameplay testing sessions.
- Conducted multiple runtime and APK tests to ensure smoother gameplay functionality and compatibility across different Android devices.
