

DAILY WORK REPORT

Date: 08/05/2026

Team Task Summary

Anoop K

Role:Python Developer

Project: Investor App

Work Completed:

The investors app project team members code integration and merge process has been completed successfully in the correct order and structure.

Currently, the Super Admin session Investor Module API development is in progress and under active processing.

The remaining functionalities, validations, and response handling are being implemented and tested to ensure smooth performance and proper data management.

Cinda sibichan

Role:Python Developer

Project: Investor App

Work Completed:

Designed and created database tables for the **Roles and Permissions module**, establishing a structured access control system within the application. The schema was designed to support scalable role-based authorization and flexible permission mapping.

Developed an API to **list available roles**, enabling retrieval of all configured system roles for administrative management and frontend integration.

Implemented an API for **assigning permissions to roles**, allowing administrators to control access levels and define feature-specific permissions for each role.

Updated the **User Login API** to align with the newly implemented role and permission system. Enhanced the authentication flow to include role-based validation and permission handling during user login.

Modified the **User Registration API** to support role assignment during user creation, ensuring newly registered users are linked with the appropriate system roles and access levels.

Improved the **Role–Permission assignment workflow**, ensuring permissions are correctly mapped and reflected in the authentication and authorization process throughout the application.

ALBIN MATHEW

Role:Python Developer

Project: Academic App

Work Completed:

Today, I worked on enhancing and stabilizing the **LMS Assessment and Evaluation workflow** by refining the **student assessment listing behavior**, improving the **result lifecycle handling**, and strengthening the **teacher review pipeline** for **descriptive and mixed-type assessments**.

I optimized the **assessment ordering logic** to ensure that newly published assessments appear first for students, improving the overall user experience. I also continued improving **validation consistency** across the **review, publish, and result visibility workflows** to maintain reliable assessment state management.

Additionally, I implemented and refined new **assessment evaluation endpoints** for **teacher-side review and result publishing**. Alongside development, I also researched and planned the architecture for the upcoming **Quiz section** and analyzed its integration and collaboration with the existing **Assessment module**, aiming to support scalable **MCQ, descriptive, and hybrid evaluation workflows** within the LMS.

Overall, the work focused on improving system stability, academic workflow accuracy, and long-term scalability of the LMS assessment ecosystem.

Karthika Jayaraj

Role:Python Developer

Project: Investor App

Work Completed:

Today, I researched the UI of the Investors App to better understand its design flow, features, and overall user experience.

Adithya P A

Role:Flutter Developer

Project: Investor App

Work Completed:

Today, I focused on updating and refining the UI across multiple sections of the Investors App. I implemented animations to improve user interaction and enhance the overall application experience.

Additionally, I created and updated the required files related to the UI modifications and animation integration to maintain proper project structure and code organization.

The updates were carried out to ensure smoother transitions, improved responsiveness, and better visual consistency throughout the application.

MUHAMMED SHIBIN K

Role: Game Developer

Project: Academic project, Rankify Test Battle

Work Completed:

Today's work focused on designing and implementing a timer system for the trivia game. The timer was integrated to track how long players take to complete a set number of questions correctly, allowing the game to validate and calculate player performance more accurately based on speed and accuracy. Optimization improvements were also made to ensure the timer updates efficiently without unnecessary UI refreshes, making it suitable for mobile gameplay. Planning was also done for integrating a leaderboard system based on player scores and completion time to create a more competitive experience and encourage player engagement through rankings and performance comparison.
